File Sharing

- Sharing of files on multi-user systems is desirable
- Sharing may be done through a protection scheme
- On distributed systems, files may be shared across a network
- Network File System (NFS) is a common distributed file-sharing method

File Sharing – Multiple Users

- User IDs identify users, allowing permissions and protections to be per-user
- Group IDs allow users to be in groups, permitting group access rights

File Sharing – Consistency Semantics

- Consistency semantics specify how multiple users are to access a shared file simultaneously
 - Similar to Ch 7 process synchronization algorithms
 - Tend to be less complex due to disk I/O and network latency (for remote file systems
 - Andrew File System (AFS) implemented complex remote file sharing semantics
 - Unix file system (UFS) implements:
 - Writes to an open file visible immediately to other users of the same open file
 - Sharing file pointer to allow multiple users to read and write concurrently
 - AFS has session semantics
 - Writes only visible to sessions starting after the file is closed

Protection

- ▶ File owner/creator should be able to control:
 - what can be done
 - by whom
- Types of access
 - Read
 - Write
 - Execute
 - Append
 - Delete
 - List

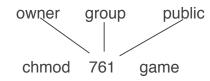

Access Lists and Groups

- Mode of access: read, write, execute
- Three classes of users

			RWX
a) owner access	7	\Rightarrow	1 1 1
			RWX
b) group access	6	\Rightarrow	1 1 0
			RWX
c) public access	1	\Rightarrow	0 0 1

- Ask manager to create a group (unique name), say G, and add some users to the group.
- For a particular file (say *game*) or subdirectory, define an appropriate access.

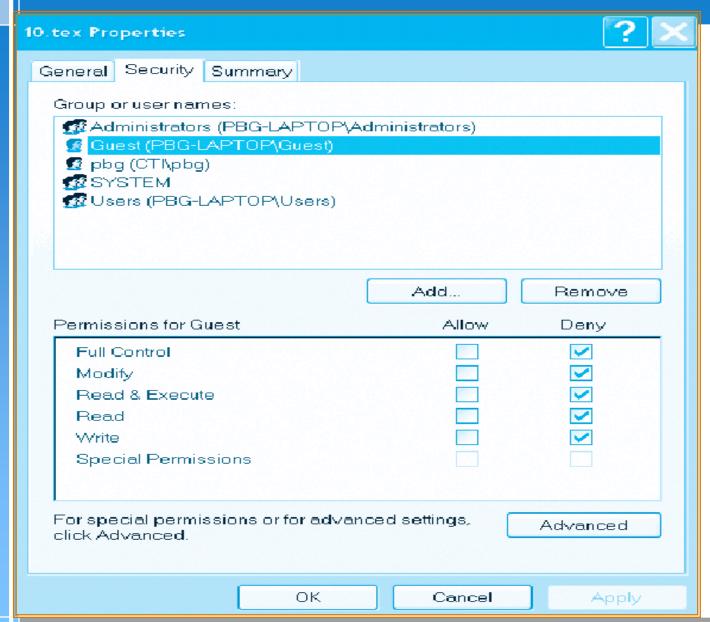

Attach a group to a file

chgrp G game

Chapter 11: File System Implementation

- File structure
 - Logical storage unit
 - Collection of related information
- File system resides on secondary storage (such as disks)
- 1. Boot control block information needed to boot
- 2. Volume control block information about volume/partitions (# blocks, size of blocks, free block count, free block pointers)
- 3. Directory structure (inode)
- 4. Per file control blocks
- File system organized into layers

Layered File System

A Typical File Control Block

▶ File control block – storage structure consisting of information about a file

file permissions

file dates (create, access, write)

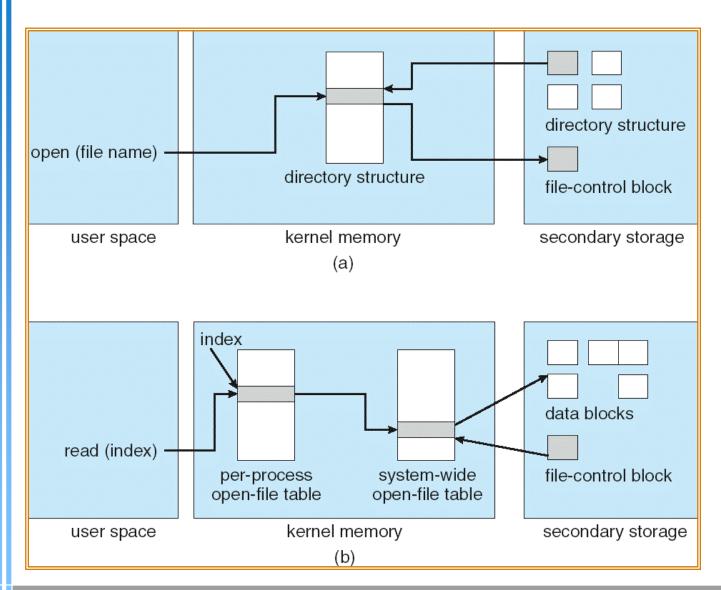

file owner, group, ACL

file size

file data blocks or pointers to file data blocks

In-Memory File System Structures

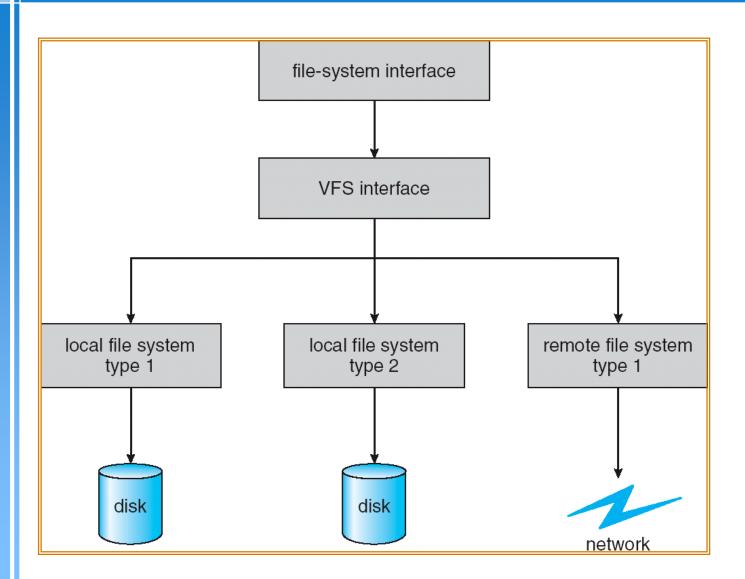

Virtual File Systems

- There are many different file systems available on any operating systems
 - Windows: NTFS, FAT, FAT32
 - Linux: ext2/ext3, ufs, vfat, ramfs, tmpfs, reiserfs, xfs ...
- Virtual File Systems (VFS) provide an objectoriented way of implementing file systems
- VFS allows the same system call interface (the API) to be used for different types of file systems
- The API is to the VFS interface, rather than any specific type of file system

Schematic View of Virtual File System

Directory Implementation

- Directories hold information about files
- Linear list of file names with pointer to the data blocks.
 - simple to program
 - time-consuming to execute
- ▶ Hash Table linear list with hash data structure.
 - decreases directory search time
 - collisions situations where two file names hash to the same location
 - fixed size

Allocation Methods

An allocation method refers to how disk blocks are allocated for files:

- Contiguous allocation
- Linked allocation
- Indexed allocation

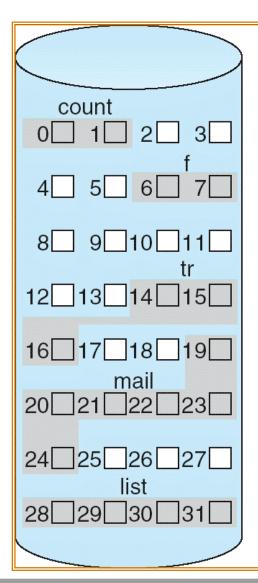

Contiguous Allocation

- Each file occupies a set of contiguous blocks on the disk
- Simple only starting location (block #) and length (number of blocks) are required
- Random access
- Wasteful of space (dynamic storageallocation problem)
- ▶ Files cannot grow

Contiguous Allocation of Disk Space

directory

file	start	length
count	0	2
tr	14	3
mail	19	6
list	28	4
f	6	2

Extent-Based Systems

- Many newer file systems (I.e. Veritas File System) use a modified contiguous allocation scheme
- Extent-based file systems allocate disk blocks in extents
- An extent is a contiguous block of disks
 - Extents are allocated for file allocation
 - A file consists of one or more extents.

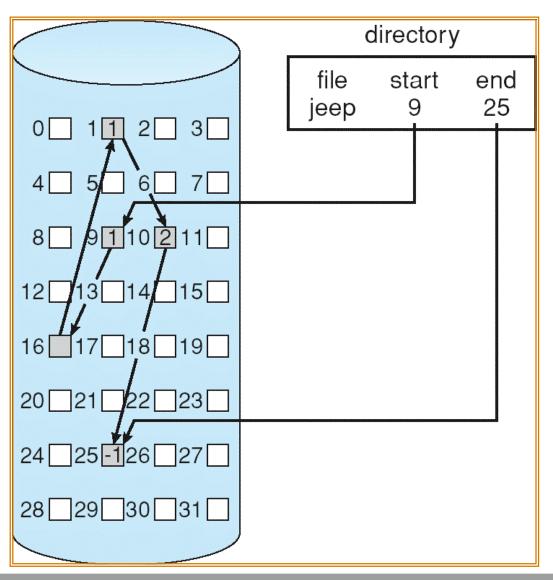

Linked Allocation

▶ Each file is a linked list of disk blocks: blocks may be scattered anywhere on the disk.

- Simple need only starting address
- ▶ Free-space management system no waste of space
- No random access

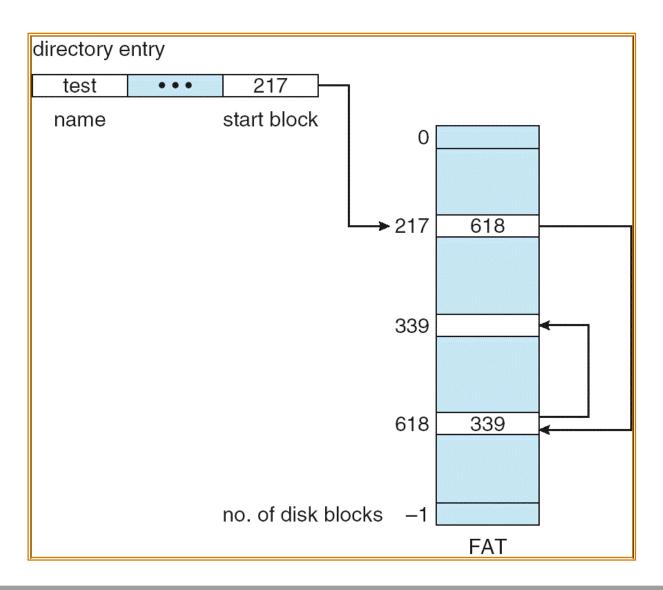

Linked Allocation

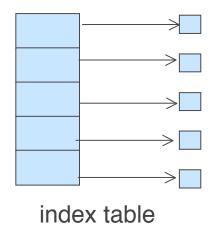

File-Allocation Table (DOS FAT)

Indexed Allocation

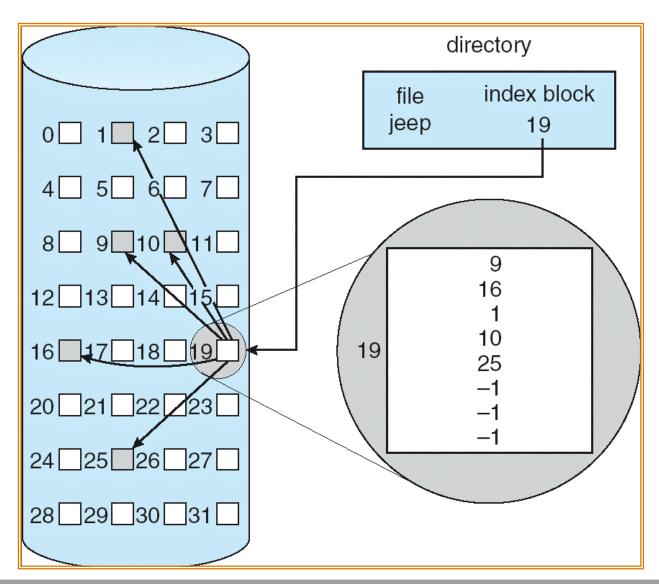

- ▶ Brings all pointers together into the *index block*.
- ▶ Logical view.

3/28/07

Example of Indexed Allocation

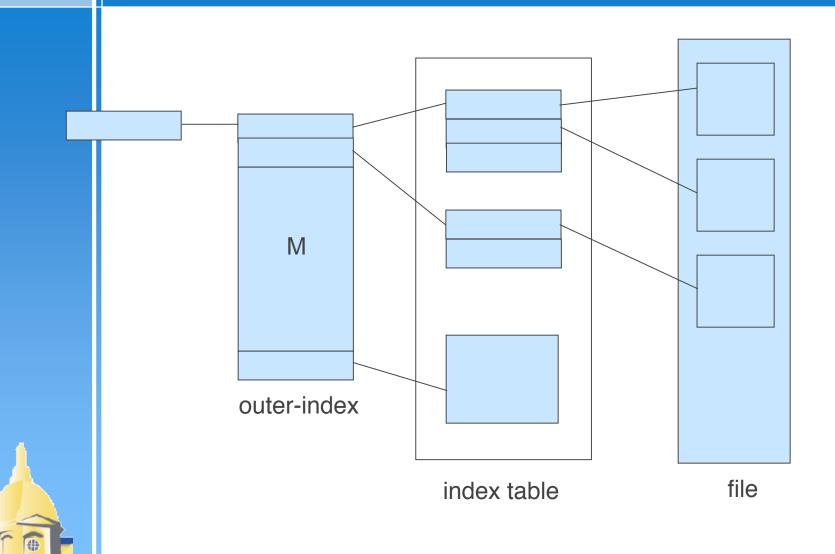

Indexed Allocation (Cont.)

- Need index table
- Random access
- Dynamic access without external fragmentation, but have overhead of index block.
- Mapping from logical to physical in a file of maximum size of 256K words and block size of 512 words. We need only 1 block for index table.

Indexed Allocation - Mapping (Cont.)

Combined Scheme: UNIX (4K bytes per block)
